

Government Solutions

Secure and Automate Your Supply Chain

The Leader in Military Logistics Intelligence

For government agencies transporting equipment, materials, fuel, refrigerated goods or supplies to troops on the ground in and out of wartime theater, it is mission-critical to know the location and status of the cargo with full turn-key trip services. By ensuring the secure delivery of high-value cargo in the most remote areas of the world, our government customers can reduce costs, better plan and focus resources and improve security, whether their cargo is traveling by ship, road or rail. ORBCOMM is a leader and trusted partner in providing cost-effective military cargo tracking and monitoring solutions that enable total in-transit visibility and complete situational awareness in the U.S. and abroad.

Enhance In-Transit Visibility

From global satellite and cellular network services to ruggedized hardware to robust web reporting applications, ORBCOMM can provide everything needed to deploy a complete, end-to-end telematics solution that meets the highest standards of security, visibility and accountability.

- **Total Chain-of-Custody:** From tractor trailers to cargo containers to rail cars, ORBCOMM's tracking solutions ensure that supplies arrive on time and are secure between origin and destination. Our RFID tags and sensors work with our advanced GPS devices to track covert and embedded cargo and send alerts for exception conditions (i.e., temperature, humidity and shock) to avoid damage, spoilage or tampering en route and facilitate virtual warehousing and inventory management.
- **Remote Asset Monitoring:** Important powered and unpowered assets such as generators or other large pieces of heavy equipment are often left to operate in far flung, remote areas. With ORBCOMM, our customers always know where every piece of equipment is deployed and how it is performing in order to improve asset utilization and optimize preventive maintenance.
- **Cargo and Fuel Theft Prevention:** Our state-of-the-art fuel monitoring system was selected by the Defense Logistics Agency to prevent theft of mission-critical fuel used by U.S. and NATO forces in Afghanistan. This solution features an integrated, dual-mode tracking device that delivers near-real-time location, fuel level and security status of fuel tankers and reports diversion or tampering with the vehicle and pilferage of fuel so immediate action can be taken.

ORBCOMM's diverse portfolio of solutions, along with our proven expertise in supporting international government programs, offers a unique blend of resources, technology and experience that is unmatched in the market today.

FEATURES

Maximize asset utilization

Improve inventory management

Enhance in-transit visibility

Secure complete situational awareness

Prevent theft and unauthorized use

Optimize preventive maintenance

Reduce operating costs
